PANEL AND RING FANS

Macheta® Airfoil Design Propellers

Direct Drive & Belt Driven

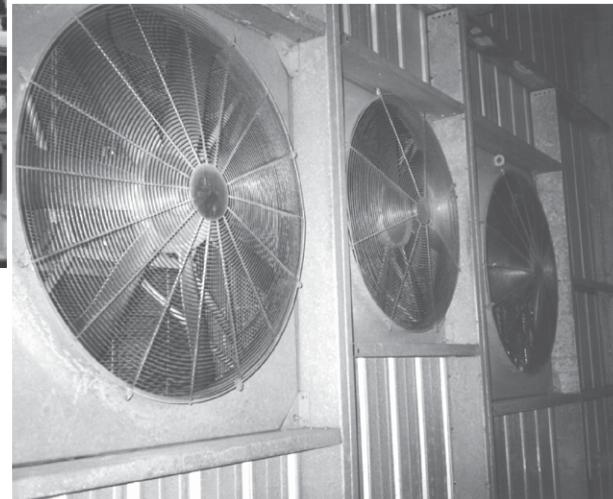

Sizes 9" thru 96"

Aerovent manufacturing facility

Aerovent has provided quality air moving and ventilation equipment for over seventy years and is a recognized leader in the industry. Aerovent maintains this status through continued research and development of innovative designs. One example of Aerovent's commitment to development is the invention of the Macheta® tip on cast aluminum airfoil blades, featured on page 3 of this bulletin.

Pictured at right is a raw product storage facility, one of the many installations of Aerovent panel fans. A raw product storage facility stores and preserves harvested produce before it is transported to supermarkets. In storage, crops such as potatoes and onions continue to breathe. They produce carbon dioxide and moisture and need fresh air (i.e., oxygen) supplied to remain fresh. Without fresh air the carbon dioxide would suffocate the produce and the high moisture content would allow mold to grow, spoiling it. The conditions of the stor-

Raw product storage panel fan installation

age area are critical for these crops to remain fresh and thus marketable. By supplying air with the Aerovent panel fans, the high content of carbon dioxide is removed and the humidity in the storage facility is reduced. For this high moisture application, the panel fans are manufactured in a direct drive arrangement, using cast aluminum wheels with hot-dipped galvanized housings.

Certification

Aerovent certifies that the Direct Drive and Belted Panel and Ring fans, and the Direct Drive and Belted Reversible Panel and Ring fans, shown on pages 10 through 22 are licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and comply with the requirements of the AMCA Certified Ratings Program.

Design Features

Propeller Design

Aerovent's trademark propeller designs are suitable for a wide variety of applications. Each propeller is manufactured to withstand the punishing loads and high rotational speeds characteristic of fan operation.

All propellers and hubs are cast from 319 aluminum as standard. Propeller sizes 9" through 72" are cast solid. Sizes 84" and 96" are adjustable pitch with individual blades and hub. For specific applications such as high temperature environments (600°F maximum), cast solid propellers are available in 240 aluminum alloy and, for corrosive environments, propellers are available in Dura-Metal (aluminum bronze, 500°F maximum) alloy.

Aerovent's trademark Macheta® propeller design is the result of many years of research and development of cast aluminum airfoil propellers. Through this research, Aerovent developed the Macheta® tip on the trailing edge of each blade to increase the fan performance. The details below describe Types M, L and S propellers.

Type M

Available in a six-blade design on sizes 9" and 12". The Type M propeller is the original Macheta® design with narrow blades and patented Macheta® tip on the trailing edge. This design offers quiet operation for small fans running at higher RPM levels, e.g., 1750 and 3450 RPM.

Type L

Available in a two-blade design on sizes 24" through 96", and a four-blade design on sizes 14" through 96". The Type L propeller was designed from the Type M Macheta® propeller, but features wider blades to meet high volumes and low noise requirements at reduced speeds.

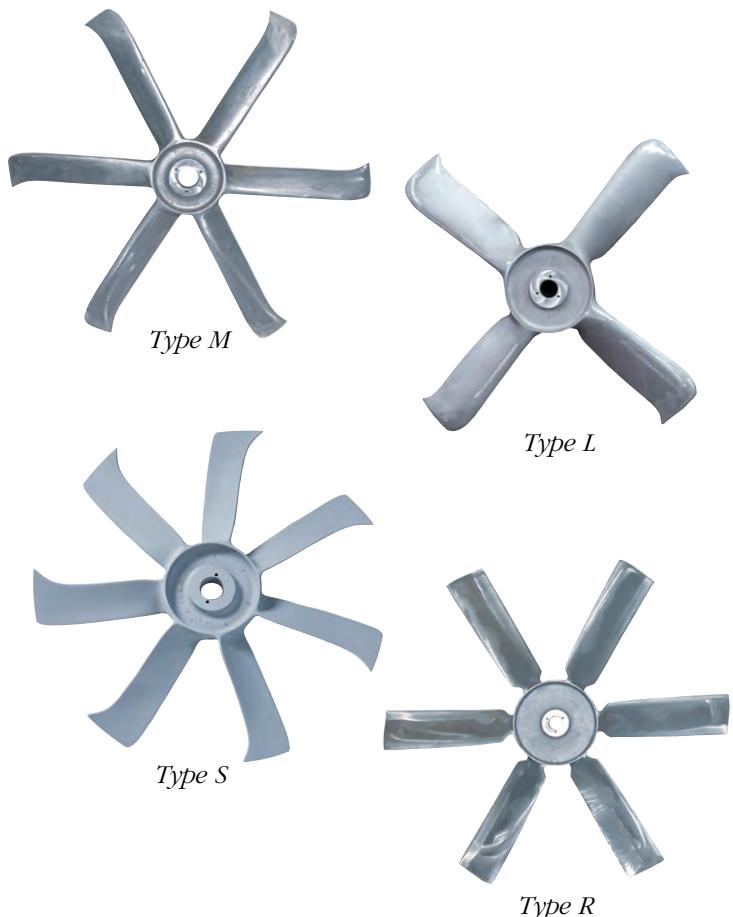

For a specified horsepower, the two-blade and four-blade designs have similar performance characteristics. Both the two-blade and four-blade designs offer quiet operation. However, the four-blade design is slightly quieter and should be used in applications where sound is critical. The two-blade configuration should be used when first cost is important.

Type S

Available in a seven-blade design on sizes 14" through 72". The Type S propeller design increases the static pressure capabilities up to 1.50", yet maintains low brake horsepower requirements. The Type S propeller is recommended for applications requiring 0.75" static pressure and higher.

Type R

Aerovent has designed and patented a truly reversible propeller designated as Type R. This blade design is capable of moving the same volume of air, at the same brake horsepower requirements, in either airflow direction. The Type R propeller design is used in both the Reversible Panel and Ring Fan, as well as in the Tu-WAY™ Roof Ventilator. (See Bulletin 615.)

The Type R propeller is available in a six-blade design on sizes 24" through 96". This propeller design is used for processes where conditions call for exhausting air during some periods and supplying air during others.

*The "Maximum Propeller RPM" table is provided for informational purposes only. RPM's shown in this table are maximum propeller speeds, NOT maximum fan speeds. Use rating tables in this bulletin as a guide for maximum fan speeds.

Standard Panel and Ring Fans

The Panel and Ring Fan housings are constructed of heavy-gauge steel with an integral deep spun orifice for greater airflow efficiency and maximum airflow capacity. If a sharp edged entrance is used, the flow is non-uniform when entering the fan, increasing the horsepower requirements and reducing the airflow capacity.

Both types of fans are also available in standard or reverse flow arrangements. A second orifice is added to convert the unit to reverse flow.

Aerovent's Panel and Ring Fans also feature an all-welded, triangulated, reinforced motor base plate to ensure the fan's long life in heavy-duty service.

Tip clearance is critical to the fan's performance and efficiency. Proper tip clearance ensures that the fan will perform according to the published performance tables. Strict quality standards are in place to maintain proper tip clearance between the propeller and the orifice.

All Panel and Ring Fans in this bulletin are licensed to bear the AMCA Seal for Air Performance. This rigorous testing procedure ensures that identical performance ratings are achieved for either housing type.

For special application requirements, Aerovent offers the following options:

- Hot dipped galvanized construction (fan housing only)
- All aluminum construction
- Various coatings and options applied directly to the fan and propeller.

All fans are furnished with standard NEMA frame motors, when motors are to be provided with the fan. This feature permits substitution to other manufacturers that use NEMA frame motors.

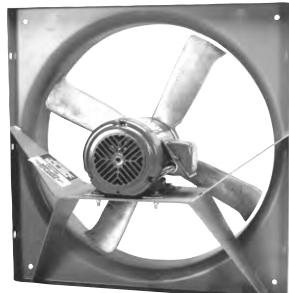

Direct Drive

Aerovent's Direct Drive Panel and Ring Fans feature low maintenance needs due to minimal moving parts. There are no fan bearings, drive sheaves or belts to maintain.

The propeller on the Direct Drive Panel and Ring Fan is attached to the motor shaft with knurled cup point setscrews on fan sizes up to 16" diameter and split taper lock bushings on fan sizes 18" and larger. These mounting techniques ensure correct alignment and positive locking of the propeller to the shaft.

Direct drive panel fan (propeller side)

Direct drive panel fan (motor side)

Belted

Aerovent's Belted Panel and Ring Fans offer performance flexibility. Belted units are available in sizes 24" to 96".

- Several fan sizes can be used for a given performance to meet an existing wall opening dimension.
- First costs can be reduced by using a more economical motor.
- Fan performance can be adjusted with a simple and inexpensive drive change if system performance changes after the fan has been installed.

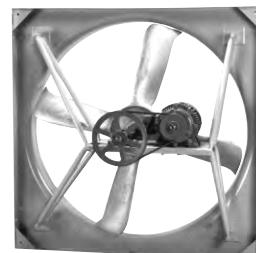

The Belted Panel and Ring Fans have the propeller secured to the fan shaft with a split taper lock bushing. Split taper lock bushings ensure correct alignment and positive locking of the propeller to the shaft.

Oversized bearings are used on Belted Panel and Ring Fans to ensure maximum bearing life for heavy-duty service.

All drive selections for Belted Panel and Ring Fans are designed with a 1.2 service factor as standard.

Belted panel fan (propeller side)

Belted panel fan (motor side)

Applications

Direct Drive Panel and Ring Fans are designed for general ventilation applications such as:

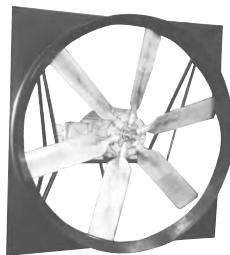

- Heat Transfer Devices
- Industrial Plants
- Raw Product Storage
- Process Equipment

Belted Panel and Ring Fans are designed for general ventilation and process cooling involving the movement of clean, ambient temperature air. Typical applications include:

- Air Filter Units
- Casting Cooling
- Cold Room Circulation
- Condensation Control
- Electrical Panel & Transformer Cooling
- Elimination of Heat Stratification
- Greenhouse Ventilation
- Non-Corrosive Fume Exhaust
- Parking Garages
- Washed Parts Drying

Reversible Panel and Ring Fans

Aerovent's reversible blade design, defined as Type R, is a truly reversible cast aluminum propeller. It is capable of moving the same volume of air, at the same brake horsepower requirements, in either airflow direction.

*Direct drive
reversible panel fan
(propeller side)*

The Reversible Panel Fan is built with an integral deep spun double orifice on sizes 24" through 48". A fabricated double tapered orifice is supplied on sizes 54" through 96". The double orifice panel is constructed of heavy-gauge steel as standard. A double orifice design allows the air to flow into the fan uniformly in both airflow directions. A uniform flow permits the fan to move the maximum volume of air at the highest efficiency.

Aerovent's Reversible Panel and Ring Fans feature an all-welded, triangulated, reinforced motor base plate to ensure the fan's long life in heavy-duty service.

Reversal of the airflow direction is easily accomplished by the flip of a switch. In a three-phase application, a simple drum switch may be used to stop the motor and restart it in the opposite direction.

IMPORTANT: Allow the fan propeller to come to a complete stop before restarting the motor in the opposite direction.

Tip clearance is critical to the fan's performance and efficiency. Proper tip clearance ensures that the fan will perform according to the published performance tables. Strict quality standards are in place to maintain proper tip clearance between the propeller and the orifice.

The Reversible Panel and Ring Fans have the propeller secured to the motor shaft for Direct Drive, and to the fan shaft for Belted, with a split taper lock bushing. Split taper lock bushings ensure correct alignment and positive locking of the propeller to the shaft.

All Reversible Panel and Ring Fans in this bulletin are licensed to bear the AMCA Seal for Air Performance.

For special application requirements, various coatings can be applied to the fan, or the fan can be manufactured in an all-aluminum construction.

All fans are furnished with standard NEMA frame motors, when motors are to be provided with the fan. This feature permits substitution to other manufacturers that use NEMA frame motors.

Direct Drive

Aerovent's Direct Drive Reversible Panel and Ring Fans feature low maintenance due to minimal moving parts. There are no fan bearings, drive sheaves or belts to maintain.

Belted

Aerovent's Belted Reversible Panel and Ring Fans have similar characteristics to the Standard Flow Belted Panel and Ring Fans.

- Several fan sizes can be used for a given performance to meet an existing wall opening dimension.
- First costs can be reduced by using a more economical motor.
- Fan performance can be adjusted with a simple and inexpensive drive change, if system performance changes after the fan has been installed.

Oversized bearings are used on Reversible Panel and Ring Fans to ensure maximum bearing life for heavy-duty service.

All drive selections for Reversible Panel and Ring Fans are designed with a 1.2 service factor as standard.

Applications

Aerovent's truly Reversible Panel and Ring Fans are an innovative design, benefiting many fan applications. They are designed for processes that need exhausting during some periods and supplying air during other periods.

For example, in foundry ventilation a reversible fan can provide better comfort ventilation by supplying air during the molding operations, and then be reversed to exhaust the smoke when the molds are poured. Using a Reversible Fan for this process saves on equipment costs. Without a Reversible Fan, two fans would be required to handle the operation: one to exhaust and one to supply air.

The development of this unique fan offers other processes this same advantage, for example:

- Arenas
- Foundry Ventilation
- Gymnasiums
- Heat Exchangers - Certain Types
- Lumber Drying Kilns
- Meat Processing Plants - Smoke Curing of Meat
- Quick-Freeze Rooms
- Special Testing Facilities

General Application Guidelines

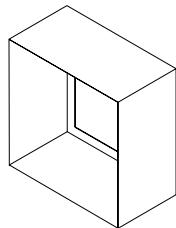

When installing Panel and Ring Fans, the following guidelines should be considered.

- Adequate make-up air is necessary to avoid excessive negative pressure.
- Two or more smaller fans may be more effective than one large fan, as two fans distribute the air better and provide the application flexibility.
- When exhausting air from heat producing equipment, locate the fan close to the equipment.
- When possible, locate the fans so they blow in the same direction as the wind.
- When supplying air to a work area, locate the fan so it blows across it.
- When supplying air into a building, locate the fan so clean outside air is being provided. It is not recommended to locate a supply fan right next to an exhaust fan.
- It is not recommended to locate fans across from each other in a confined area.

Accessories

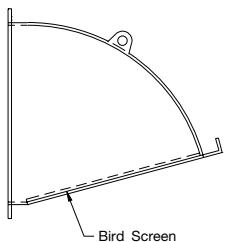

Mounting Adaptor

An all welded, heavy-gauge, square wall box is designed for mounting the fan and its accessories (e.g., shutter, weatherhood, mounting plate and guards) to the wall.

Weatherhood

The weatherhood protects the fan, shutter and inside the building against rain and snow. It can be sized to fit the mounting adaptor or the wall opening. It includes a bird screen.

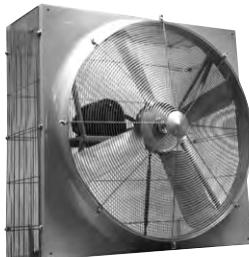

Wire Safety Guards

Round OSHA Type – “PMS” Guard

A spiral type guard with electroplated zinc and special lacquer finish that meets Occupational Safety and Health Act Standards (OSHA). The guard is mounted on the propeller side of the Panel and Ring Fan for employee safety and protection of the fan propeller.

Square OSHA Type – “WWII” Guard

The bolt together guard design comes in five pieces for quick assembly. The design meets Occupational Safety and Health Act Standards (OSHA). This guard is mounted on the motor-side of the Panel Fan for employee safety and protection of the motor and drives.

Round Fabricated Wire Basket “WMF” Guard

The rugged “WMF” guard is used on Ring Fans only. It is fabricated of 1" x 1" wire mesh and reinforced with angle rings, for heavy duty service. An optional 1/2" x 1/2" mesh is also available. The “WMF” guard mounts directly to the wall and completely encloses the ring fan for added safety. The guard does not mount directly to the ring fan itself.

Round Split Wire Guard

Specifically designed for Ring Fans, the Split Wire Guard provides easy access to the motor. It is mounted between the fan propeller and the motor, covering the propeller for employee safety, while still allowing the motor to be serviced.

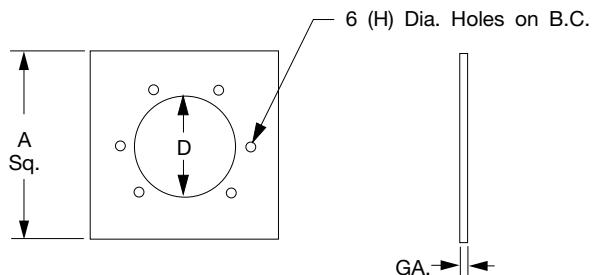

Corrosion Resistant Construction

For handling corrosive fumes, etc., the fan housing can be constructed of hot dipped galvanized steel, stainless steel, aluminum, or protected with a wide variety of suitable coatings, such as Plasite or Heresite. Aerovent also manufactures fiberglass Panel Fans for corrosive environments. (See Bulletin 185.)

Mounting Plate

The mounting plate is designed to mount the Ring Fan to the wall opening or to the mounting adaptor.

FAN SIZE	A	D	H	B.C.	GA

Accessories

Shutters

Motor Operated

- a) The motor-operated, end pivoted shutter is for ex-haust only. It is constructed of welded steel frames, aluminum felt edge blades and drilled for easy mounting. This shutter can also be manufactured in an all-aluminum construction.
- b) The motor-operated, center pivoted shutter, manufactured by Aerovent, can be used for either supply or exhaust applications. It is constructed of:
- 12-gauge galvanized steel frame
 - 16-gauge galvanized blades
 - stainless steel jamb seals
 - oil impregnated bronze bushings
 - 120V spring return damper actuator with end switch

Motor operated end pivoted shutter

Motor operated center pivot shutter. Actuator includes end switch.

Gravity Operated

The automatic shutter is for exhaust only. It is constructed of welded steel frames, aluminum felt edge blades and drilled for easy mounting. This shutter can also be manufactured in all-aluminum construction.

Automatic shutter

Fan Motor Options

ODP		TEFC		EXPLOSION PROOF	
SINGLE PHASE	THREE PHASE	SINGLE PHASE	THREE PHASE	SINGLE PHASE	THREE PHASE
115V	200/208V	115V	200/208V		200/208V
115/230V	230/460V	115/230V	230/460V	115/230V	230/460V
	380V		380V		380V
	460V		460V		460V
	575V		575V		575V

Fan motors are foot mounted NEMA Design B, standard industrial, continuous duty, ball bearing, variable torque type. These motors are suitable for operation on voltage, phase and hertz, as listed above. Motor bearings have a minimum L-10 life as defined by AFBMA of at least 40,000 hours (200,000 hours average life). See factory for special motor requirements.

Design Information

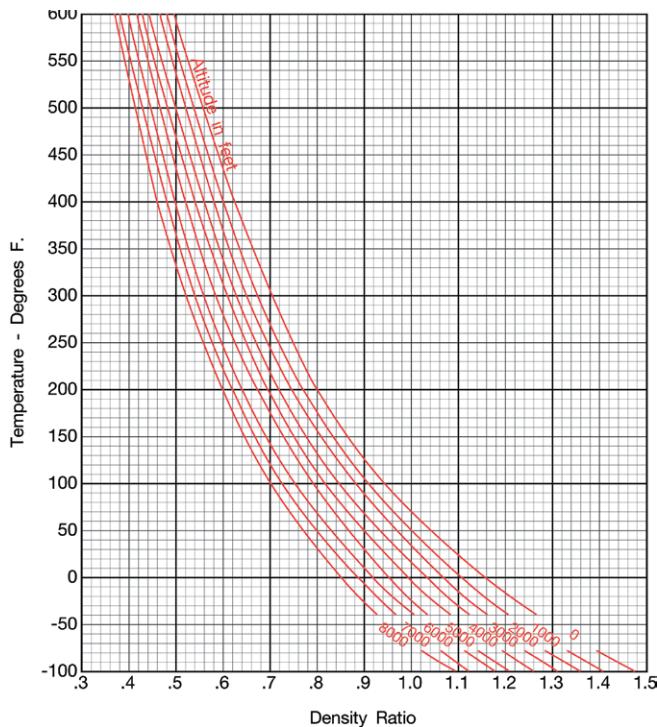

Temperature and Altitude Correction

A fan with a given blade angle and speed is a constant volume machine. The CFM remains constant regardless of changes in temperature and altitude. The weight of air handled by the fan changes in proportion to the density. Standard air (70°F at sea level) weighs 0.075 pounds per cubic foot. The tables show fan performance for air of this density. For air of different weight the static pressure and horsepower change in direct proportion to the density.

Locate the operating condition in the Density Ratio Chart; for example, 50°F and 7,000 feet altitude. The density ratio is 0.8; therefore, the air would weigh $0.075 \times 0.8 = 0.06$ pounds per cubic foot. The fan static pressure and horsepower as shown in the tables must be multiplied by this density ratio (0.8) to correct them to the specified conditions.

For example, the table on page 11 lists a Direct Drive Panel Fan, Model 24L420, 1750 RPM for 6,240 CFM at $\frac{1}{2}$ " SP, requiring 1.02 BHP. The actual performance at 50°F and 7,000 feet altitude would be 6,240 CFM at 0.4" SP, 1750 RPM, requiring 0.816 BHP. (Both horsepower and static pressure multiplied by the density ratio; other factors remain constant.)

Density Ratio

Recommended Air Changes

TYPE OF APPLICATION	MINUTES PER CHANGE
AUDITORIUMS	3 – 10
BAKERIES	1 – 3
BOILER ROOMS	1 – 3
CLEANING & DRYING	3 – 5
CREAMERIES – DAIRIES	3 – 6
ENGINE ROOMS	2 – 5
FACTORIES	4 – 10
FOUNDRIES	2 – 8
GARAGES	5 – 10
KITCHENS	2 – 3
LABORATORIES	5 – 10
LAUNDRIES	1 – 3
LOCKER ROOMS	4 – 30
MACHINE SHOPS	5 – 10
MILLS	5 – 8
OFFICES	5 – 12
PACKING HOUSE	3 – 5
PLATING ROOMS	1 – 5
PRINTING SHOPS	5 – 10
RESTROOMS	5 – 10
SCHOOLS	5 – 10
TRANSFORMER ROOMS	1 – 5
WAREHOUSES	5 – 10

To determine required fan capacity, divide the cubic content of the room by the interval of air change.

For example, 75 ft. (length) x 30 ft. (width) x 12 ft. (height) = 27,000 ÷ 3 (minutes per change) = 9,000 CFM (fan capacity).

Temperature Limitations

PART	MIN. AMBIENT TEMP. (°F)	MAX. AMBIENT TEMP. (°F)
STANDARD BEARINGS & GREASE	-30°F	140°F
CAST ALUMINUM PROPELLER	-100°F	275°F
MOTOR WITH CLASS B INSULATION	-10°F	104°F
MOTOR WITH CLASS F INSULATION	-10°F	149°F
MOTOR WITH CLASS H INSULATION	-10°F	194°F
STANDARD PAINT	-40°F	300°F

NOTE:

Due to motors operating directly in the airstream, Panel and Ring Fan temperature limitations are based on the motor insulation.

Design Information

Sound Level

Aerovent furnishes sound power level ratings by octave bands. These ratings are obtained by the testing method described in AMCA 300, *Reverberant Room Method For Sound Testing of Fans*, published in accordance with AMCA Standard 301, *Methods for Calculating Fan Sound Ratings From Laboratory Test Data*.

- AMCA 300 - Describes the test method for determining the sound levels of a fan.
- AMCA 301 - Describes the standard method of publishing sound ratings.

When discussing sound, two units of sound measurement are used. Their definitions are as follows:

Sound Power Level = The total amount of acoustical energy the fan develops, like a light bulb rating of 100 watts. This value is constant. It is not dependent on distance.

Sound Pressure Level = The sound that is heard or the loudness level of the sound, like the brightness level of the light bulb. This value varies with the distance from the sound source and the environment of the sound source.

The Sound Power Level rating is stated for eight frequency bands called octave bands. The single value for each band is the average of that frequency band. An overall value, called the L_{WA}, which is a mathematical summation of these eight octave bands converted to the A scale, permits comparison of noise levels.

In the present sound testing procedures, the accuracy in determining sound power levels is $\pm 2\text{dB}$, per AMCA 303-79. In other words, "when comparing different manufacturers, it is good practice to disregard differences of less than 4dB."* This is due to the fact that the human ear cannot distinguish a variation in noise until the difference in noise level between noise sources is greater than 3dB.

Important Note: It cannot be overemphasized that there is no such thing as dBA rating. If a rating is requested in a specification it must be in terms of octave band sound power.

*"Application of Sound Power Level Ratings for Fans," AMCA Publication 303-79

Fan Performance Changes

There are many reasons why a fan's performance may need to be changed.

- The process or room requires additional airflow (CFM).
- More ductwork is added which increases the system static pressure (SP).

It is important to understand how the fan's performance is affected. The effect of a system change on the fan's performance can be determined by using relationships known as "fan laws:"

$$\text{CFM}_2 = (\text{RPM}_2 / \text{RPM}_1) * \text{CFM}_1$$

$$\text{SP}_2 = (\text{RPM}_2 / \text{RPM}_1)^2 * \text{SP}_1$$

$$\text{BHP}_2 = (\text{RPM}_2 / \text{RPM}_1)^3 * \text{BHP}_1$$

Note: Subscript 1 describes the existing conditions.

Subscript 2 describes the new conditions.

Example

The system requires a fan operating at 15300 CFM at 0.125" SP. A Belted Panel Fan is required, per the specifications.

- a) Using Aerovent's Bulletin 168, we select a 42L428 BP fan. This fan will operate at 580 RPM and 1.09 BHP, for 15300 CFM at 0.125" SP.
- b) After installing the fan, the plant manager wants to increase the airflow into the plant to 20,000 CFM. We must use the fan laws to determine how this fan will be affected.

Known:

$$\text{CFM}_1 = 15,300 \text{ CFM}$$

$$\text{CFM}_2 = 20,000 \text{ CFM}$$

$$\text{RPM}_1 = 580 \text{ RPM}$$

$$\text{SP}_1 = 0.125" \text{ SP}$$

$$\text{BHP}_1 = 1.09 \text{ BHP}$$

Unknown:

$$\text{RPM}_2, \text{SP}_2, \text{BHP}_2$$

- c) Using the fan laws, we solve for RPM₂, SP₂ and BHP₂:

$$\text{RPM}_2 = (20000 / 15300) * 580 = 758 \text{ RPM}$$

$$\text{SP}_2 = (758 / 580)^2 * 0.125" = 0.214" \text{ SP}_2$$

$$\text{BHP}_2 = (758 / 580)^3 * 1.09 = 2.43 \text{ BHP}_2$$

Therefore:

- 1) In order to use the same fan for an airflow of 20,000 CFM, the RPM must be increased to 758 RPM.
- 2) To move 20,000 CFM, this fan requires 2.43 BHP or a 3 HP motor. If the fan is increased to 758 RPM and the motor is not changed to a 3 HP motor, the original motor will overload or the controls monitoring the system will turn the fan off automatically.

Important Note: The new RPM should be checked to make sure it does not exceed the maximum allowable fan RPM. Use rating tables in this bulletin as a guide. If the new RPM exceeds the rating table, consult the factory.

Performance Data – Standard Panel & Ring Fans

To identify a specific fan for ordering or engineering specification, it is necessary to show the complete catalog number. All performance data is available in curve form upon request. All capacities shown in the performance tables below are for standard air conditions: 70°F at sea level (0.075 lbs./cu.ft. air density).

Aerovent certifies that the Direct Drive and Belted Panel and Ring Fans shown on pages 10 through 17 are licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and comply with the requirements of the AMCA Certified Ratings Program.

Performance Data – Reversible Panel & Ring Fans

To identify a specific fan for ordering or engineering specification, it is necessary to show the complete catalog number. All performance data is available in curve form upon request. All capacities shown in the performance tables below are for standard air conditions: 70°F at sea level (0.075 lbs./cu.ft. air density).

Aerovent certifies that the Reversible Direct Drive and Belted Panel and Ring Fans shown on pages 18 through 22 are licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and comply with the requirements of the AMCA Certified Ratings Program.

*R6 is a manually adjustable pitch prop.

NOTES: Performance certified is for installation type A: Free inlet, free outlet.

Power rating (BHP) includes transmission losses.

Performance ratings do not include the effects of appurtenances (accessories).

Typical Specifications

Direct Drive Panel and Ring Fans

Fans, where indicated on drawings and schedules, shall be Direct Drive Panel or Ring Fans as manufactured by Aerovent, Minneapolis, Minnesota, and shall be of the size and capacity as indicated in the fan schedule. Direct Drive Panel and Ring Fans shall be tested and certified in accordance with ANSI/ASHRAE 51-1985 and ANSI/AMCA 210-85 test codes and guaranteed by the manufacturer to deliver at the rated published performance levels. In addition, each unit shall be factory run tested prior to shipment. Direct Drive Panel or Ring Fans shall be licensed to bear the AMCA Certified Rating Seal for Air Performance.

CONSTRUCTION — The fan casing shall be constructed of mild steel with an integral deep spun orifice.

- For Panel and Ring sizes through 21" the housing shall be 16-gauge.
- For Panel and Ring sizes 24" through 48" the housing shall be 14-gauge.
- For Panel sizes 54" through 72" and Ring sizes 54" through 96", the housing shall be 12-gauge.

Construction for Reverse Flow Panel Fans sizes 9" through 48" shall be accomplished by adding a half orifice to the outlet venturi.

Direct Drive Panel and Ring Fans shall be constructed with a welded reinforced motor base plate which is supported by a welded spider type frame. The reinforced motor base plate shall be welded to the leaving airside of the panel. This construction allows for mounting the unit from the flanged front entrance orifice.

PROPELLERS — The precision Macheta® tipped airfoil fan blades and hub shall be cast of 319 aluminum alloy. The propeller shall be mounted directly on the motor shaft with knurled cup point setscrews on sizes up to 16" diameter and split taper lock bushings on sizes 18" and larger.

BALANCING — The propeller assembly shall be statically and dynamically balanced in accordance with ANSI/AMCA 204-96 "Balance Quality and Vibration Levels for Fans" to Fan Application Category BV-3, Balance Quality Grade G6.3. In addition, direct drive fan propellers shall be balanced on the motor shaft after final assembly in the fan casing, in the manufacturing facility, to the following peak velocity values, filter-in, at the fan test speed:

Fan Application Category	Rigidly Mounted (In/Sec)	Flexibly Mounted (In/Sec)
BV-3	0.15	0.20

MOTORS — Fan motors shall be foot mounted NEMA Design B, standard industrial, continuous duty, ball bearing, variable torque type suitable for operation on voltage, phase and hertz, as listed in the fan schedule. Motor bearings shall have a minimum L-10 life, as defined by AFBMA, of at least 40,000 hours (200,000 hours average life).

FINISH — The unit, after fabrication, shall be cleaned and chemically pretreated by a phosphatizing process and shall be painted inside and outside with an air dry enamel.

OPTIONAL ACCESSORIES — The fans shall be furnished complete with:

- Mounting Adapter
- Mounting Plate – Ring Fans only
- Reverse Flow Construction
- Weatherhood

Shutters

- Automatic Shutter (steel/aluminum)
- Motor Operated Center Pivot Shutter
(actuator includes end switch)

Motor Operated End Pivoted Shutter
(steel/aluminum)

Guards:

- Round "PMS" Guard
- Square "WWII" Guard
- Round Split Wire Guard – Ring Fans Only
- Round Fabricated Wire Basket "WMF" Guard – Ring Fans Only

Typical Specifications

Belted Panel and Ring Fans

Fans, where indicated on drawings and schedules, shall be Belted Panel or Ring Fans as manufactured by Aerovent, Minneapolis, Minnesota, and shall be of the size and capacity as indicated in the fan schedule. Belted Panel and Ring Fans shall be tested and certified in accordance with ANSI/ASHRAE 51-1985 and ANSI/AMCA 210-85 test codes and guaranteed by the manufacturer to deliver at the rated published performance levels. In addition, each unit shall be factory run tested prior to shipment. Belted Panel or Ring Fans shall be licensed to bear the AMCA Certified Rating Seal for Air Performance.

CONSTRUCTION — The fan casing shall be constructed of mild steel with an integral deep spun orifice.

- For Panel and Ring sizes 24" through 48", the housing shall be 14-gauge.
- For Panel sizes 54" through 72", the housing shall be 12-gauge.
- For Ring sizes 54" through 96", the housing shall be a tapered orifice.

Construction for Reverse Flow Panel Fans sizes 24" through 48" shall be accomplished by adding a half orifice to the outlet venturi.

Belted Panel and Ring fans shall be constructed with a welded reinforced motor base plate which is supported by a welded spider type frame. This construction will allow for mounting the unit from the flanged front entrance orifice.

PROPELLERS — The precision Macheta® tipped airfoil fan blades and hub shall be of cast 319 aluminum alloy. The propeller shall be secured to the fan shaft with a split taper lock bushing. Compression holds the bushing in place and it is keyed to the shaft to prevent slipping or loosening.

BEARINGS — All Belted Panel and Ring Fans shall be supplied with sealed pillow block bearings. The bearings shall have a minimum L-10 life as defined by AFBMA of at least 20,000 hours (100,000 hours average life).

DRIVES — All drive selections on Belted Panel and Ring Fans shall be designed with a 1.2 service factor, unless otherwise specified. Sheaves shall be cast iron with static conducting belts. The adjustment of the belt tension is accomplished with an adjustable motor base.

BALANCING — The propeller assembly shall be statically and dynamically balanced in accordance with ANSI/AMCA 204-96 "Balance Quality and Vibration Levels for Fans" to Fan Application Category BV-3, Balance Quality Grade G6.3. In addition, belted fan propellers shall be balanced on the fan shaft after final assembly in the fan casing, in the manufacturing facility, to the following peak velocity values, filter-in, at the fan test speed:

Fan Application Category	Rigidly Mounted (In/Sec)	Flexibly Mounted (In/Sec)
BV-3	0.15	0.20

MOTORS — Fan motors shall be foot mounted NEMA Design B, standard industrial continuous duty, ball bearing (ODP, TEAO, TEFC, FCXP) variable torque type suitable for operation on voltage, phase and hertz as listed in the fan schedule.

FINISH — The unit, after fabrication, shall be cleaned and chemically pretreated by a phosphatizing process and shall be painted inside and outside with an air dry enamel.

OPTIONAL ACCESSORIES — The fans shall be furnished complete with:

- Mounting Adapter
- Mounting Plate – Ring Fans only
- Reverse Flow Construction
- Weatherhood

Shutters

- Automatic Shutter (steel/aluminum)
- Motor Operated Center Pivot Shutter
(actuator includes end switch)

Motor Operated End Pivoted Shutter
(steel/aluminum)

Guards:

- Round "PMS" Guard
- Square "WWII" Guard
- Round Split Wire Guard – Ring Fans Only
- Round Fabricated Wire Basket "WMF" Guard – Ring Fans Only

Typical Specifications

Direct Drive Reversible Panel and Ring Fans

Fans, where indicated on drawings and schedules, shall be Direct Drive Reversible Panel or Ring Fans as manufactured by Aerovent, Minneapolis, Minnesota, and shall be of the size and capacity as indicated in the fan schedule. Direct Drive Reversible Panel and Ring Fans shall be tested and certified in accordance with ANSI/ASHRAE 51-1985 and ANSI/AMCA 210-85 test codes and guaranteed by the manufacturer to deliver at the rated published performance levels. In addition, each unit shall be factory run tested prior to shipment. Direct Drive Reversible Panel or Ring Fans shall be licensed to bear the AMCA Certified Rating Seal for Air Performance.

CONSTRUCTION — For Panel and Ring Fans sizes 24" through 48" the fan casing shall be constructed of 14-gauge mild steel with an integral deep spun double orifice.

For Panel Fans sizes 54" through 72", the double tapered orifice shall be fabricated using 12-gauge mild steel and welded construction.

Reversible Flow Ring Fans sizes 54" through 96" shall utilize 12-gauge fabricated tapered rings.

Reversal of the airflow direction is accomplished by stopping the motor and restarting it in the opposite direction. No mechanical adjustment is necessary. **Important:** Allow the fan propeller to come to a complete stop before restarting the motor in the opposite direction.

Direct Drive Reversible Panel and Ring Fans shall be constructed with a welded reinforced motor base plate that is supported by a welded spider type frame.

PROPELLERS — Propellers shall be 319 cast aluminum alloy and shall be capable of moving the same volume of air in either airflow direction. A split taper lock bushing shall be used to mount the propeller directly on the motor shaft.

BALANCING — The propeller assembly shall be statically and dynamically balanced in accordance with ANSI/AMCA 204-96 "Balance Quality and Vibration Levels for Fans" to Fan Application Category BV-3, Balance Quality Grade G6.3. In addition, direct drive fan propellers shall be balanced on the motor shaft after final assembly in the fan casing, in the manufacturing facility, to the following peak velocity values, filter-in, at the fan test speed:

Fan Application Category	Rigidly Mounted (In/Sec)	Flexibly Mounted (In/Sec)
BV-3	0.15	0.20

MOTORS — Fan motors shall be foot mounted NEMA Design B, standard industrial, continuous duty, ball bearing, variable torque type suitable for operation on voltage, phase and hertz, as listed in the fan schedule. Motor bearings shall have a minimum L-10 life, as defined by AFBMA, of at least 40,000 hours (200,000 hours average life).

FINISH — The unit, after fabrication, shall be cleaned and chemically pretreated by a phosphatizing process and shall be painted inside and outside with an air dry enamel.

OPTIONAL ACCESSORIES — The fans shall be furnished complete with:

- Mounting Adapter
- Mounting Plate – Ring Fans only
- Weatherhood

Shutters

- Automatic Shutter (steel/aluminum)
- Motor Operated Center Pivot Shutter (actuator includes end switch)
- Motor Operated End Pivoted Shutter (steel/aluminum)

Guards:

- Round "PMS" Guard
- Square "WWII" Guard
- Round Split Wire Guard – Ring Fans Only
- Round Fabricated Wire Basket "WMF" Guard – Ring Fans Only
